

Paper Plots V1

Brett Stacy

2024-11-25

Introduction

Plots for paper:

1. Time series of new ISS vs old. Accompanied by number of hauls, nominal sample size, and possibly RSS boxplots. RSS boxplots may help justify focusing in on 20 sample size median for later plots to get an apples to apples, granular test of impact of sample size and expansion complexity.
 2. ISS full, ISS without expansion, ISS without sampling strata, ISS without either.
 3. 3x3 grid: sample size 10, 20, 30 fixed X expansion none, haul only, haul+month. With sampling strata.
- 3.sup.1: same as above but without sampling strata. 3.sup.2: same as above but without bootstrapping trip. 3.sup.3: same as above but without either.

Plot 1.1

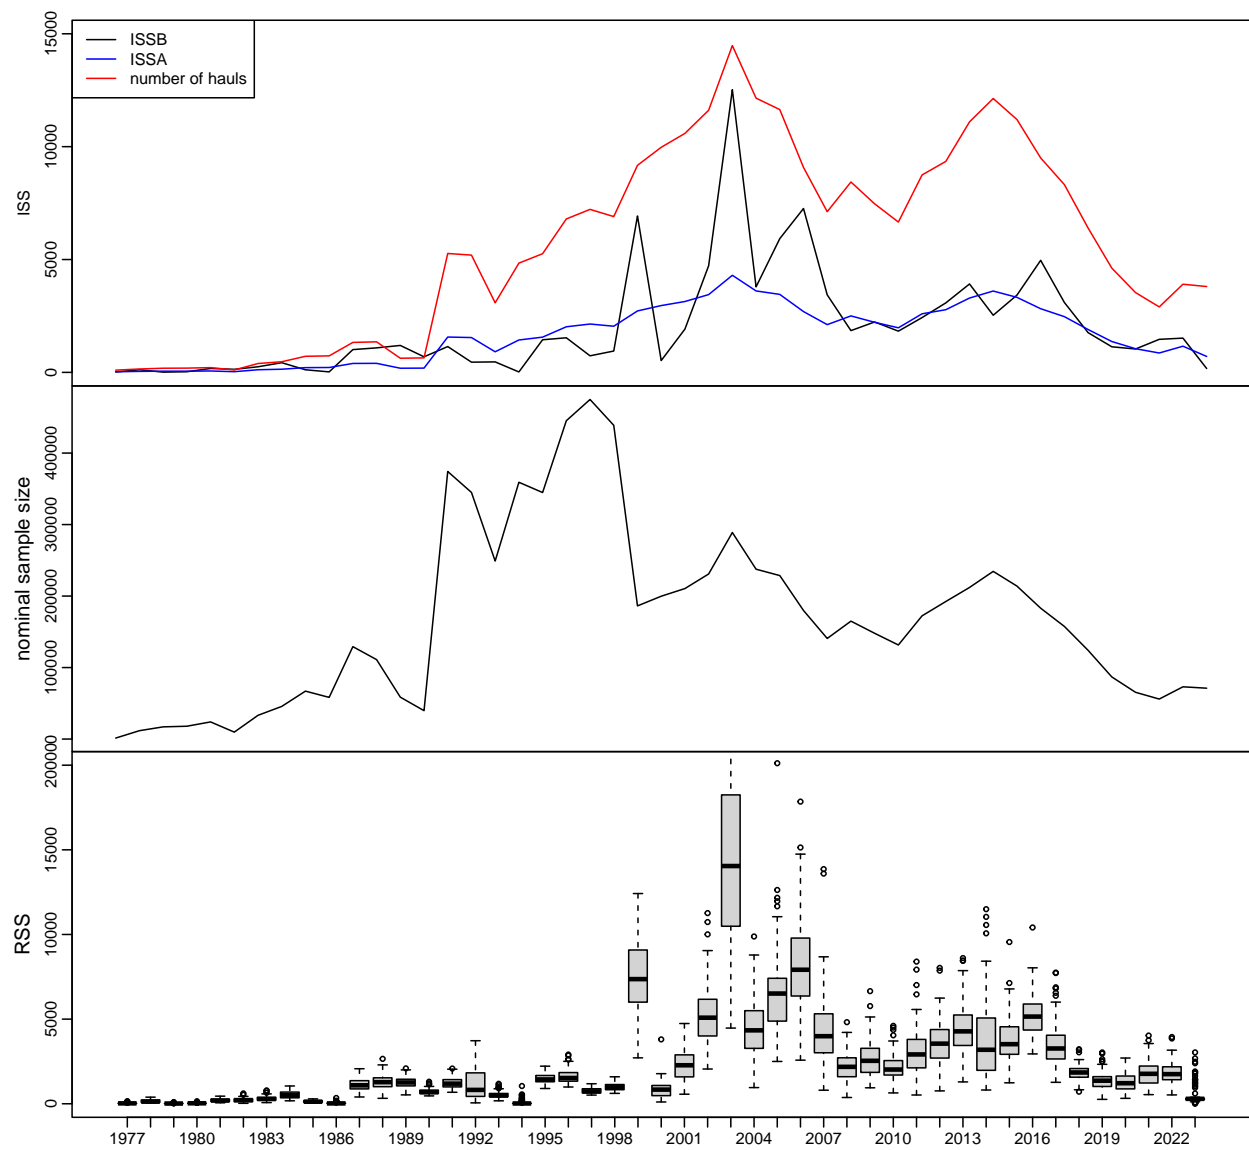

baseISS with assessment ISS

All together 4 panel

All together 3 panel

* All together 2 panel

All together TRIPS TOO 4 panel

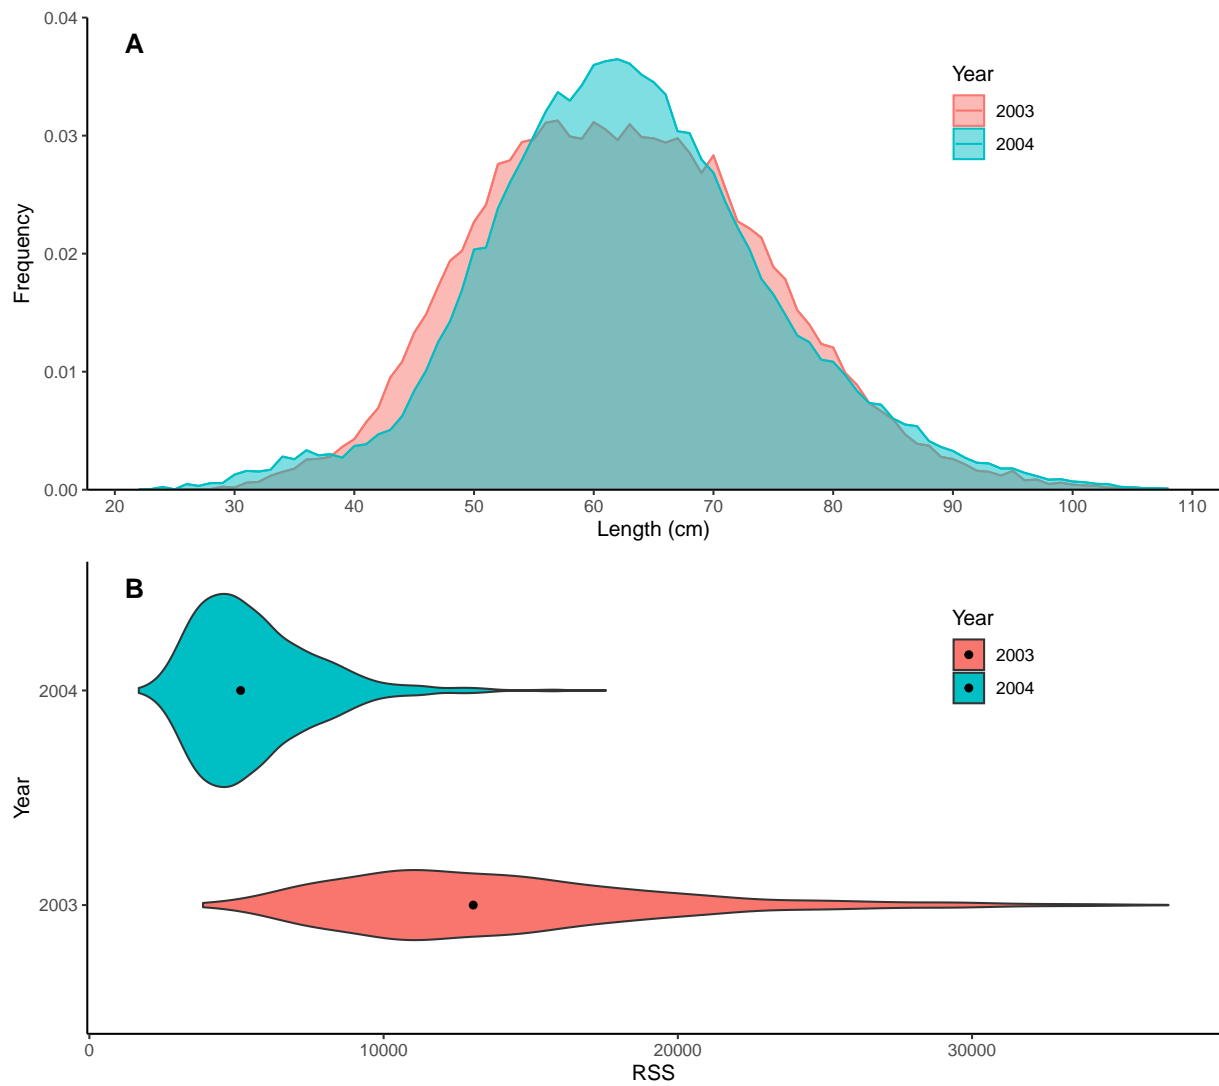

All together TRIPS TOO 3 panel

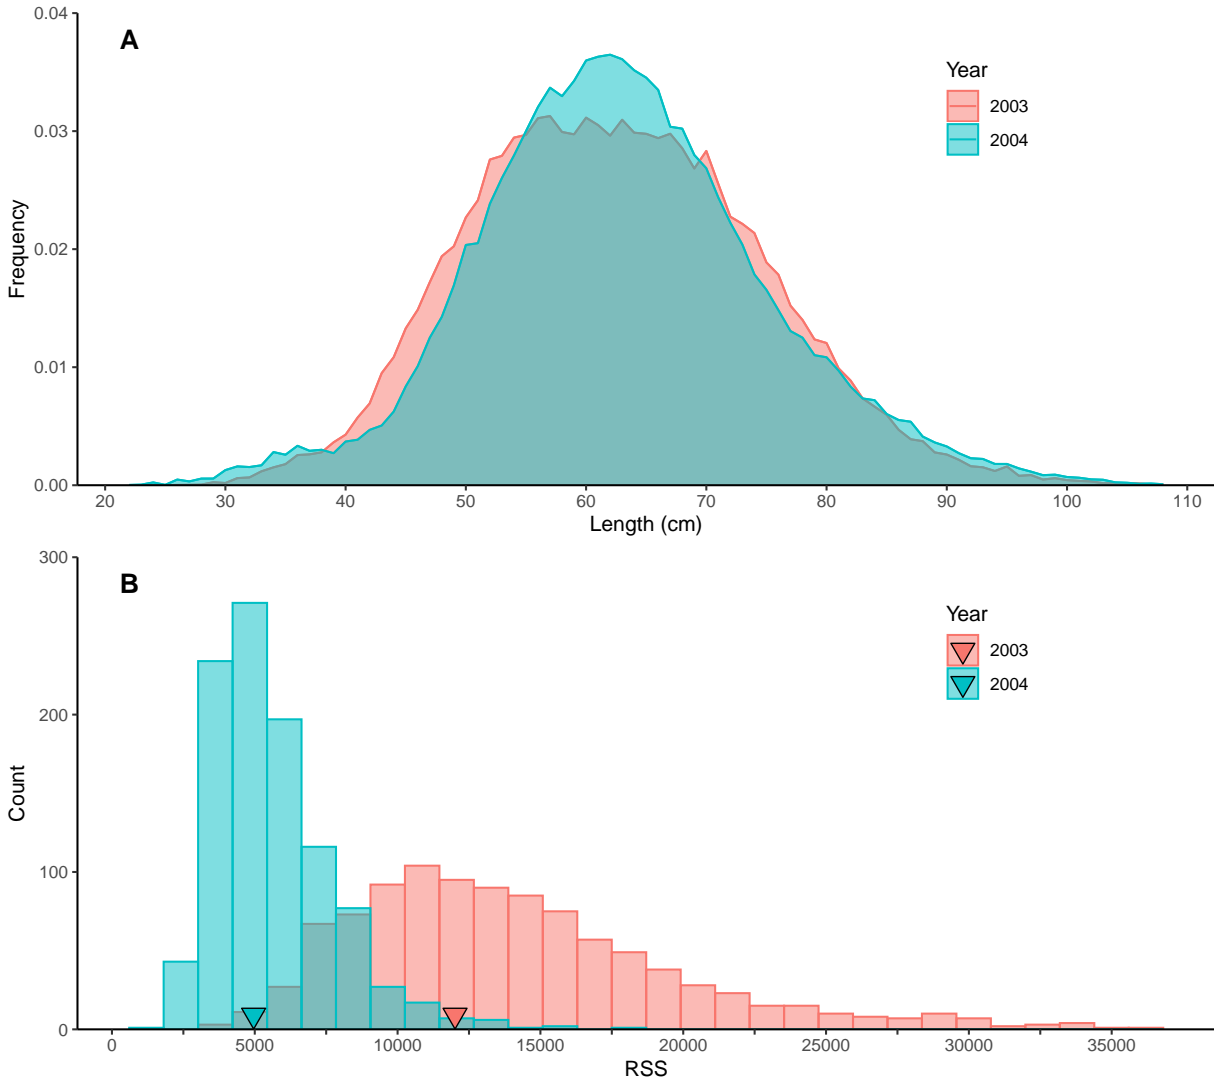

All together TRIPS TOO 4 panel sample rate by HAUL on bottom

1999 and 2000 histograms

* Histograms

The comparison shows that fish in 2003 were less similar in length compared to 2004. 2003 corresponds to a higher ISS even though the sample rate was the same and the number of hauls and nominal sample size were comparable. More of the fish sampled in 2003 were required for characterizing the underlying multinomial sampling distribution compared to 2004 because more lengths were represented at a higher rate in 2003 (shorter, wider distribution). This is reflected in the RSS (ref figure).

Simulate Multinomials

Plot new number of hauls vs old

Inspect R-squared Fit models to number of hauls.

Plot 2.1

Deconstruct the contributors to baseISS

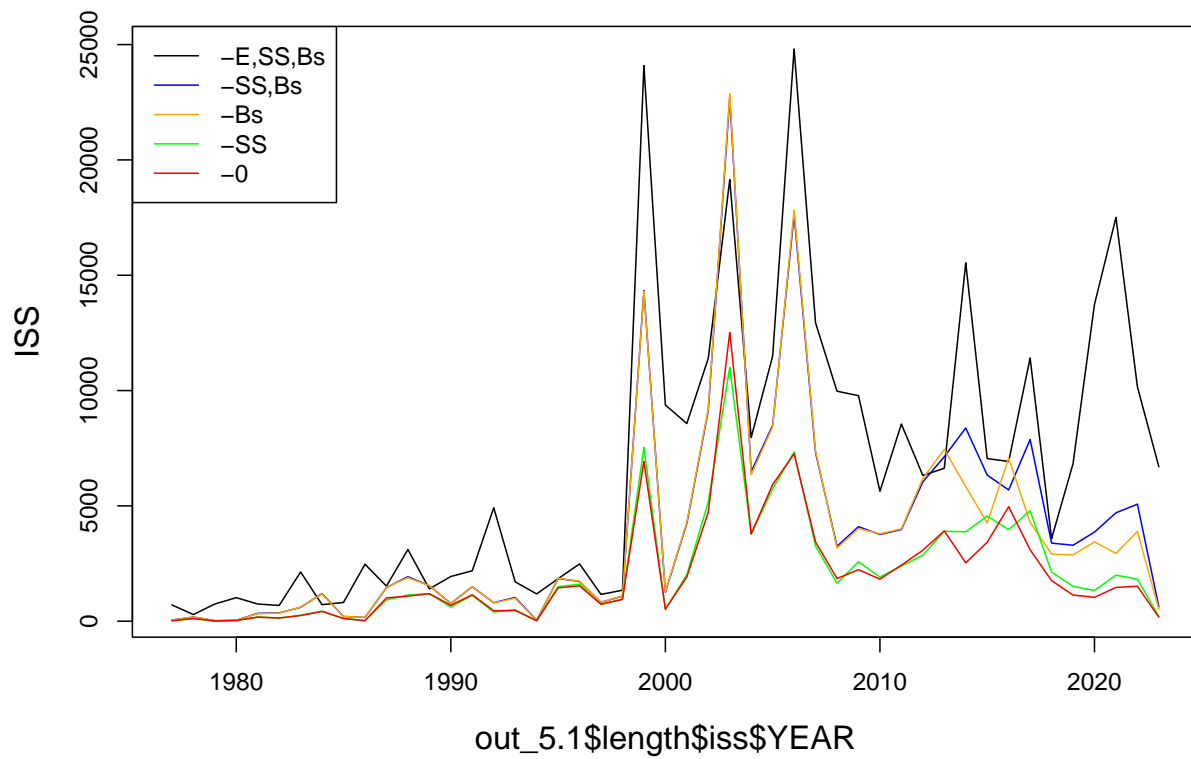

All together 1

Subtracting things from baseISS

All together 2

Adding things to baseISS

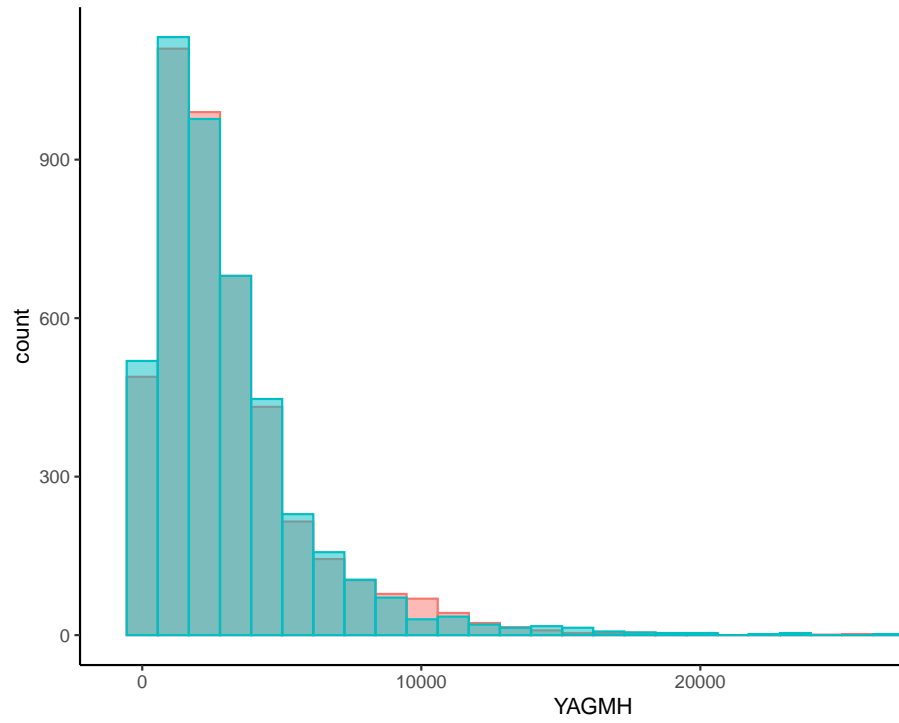

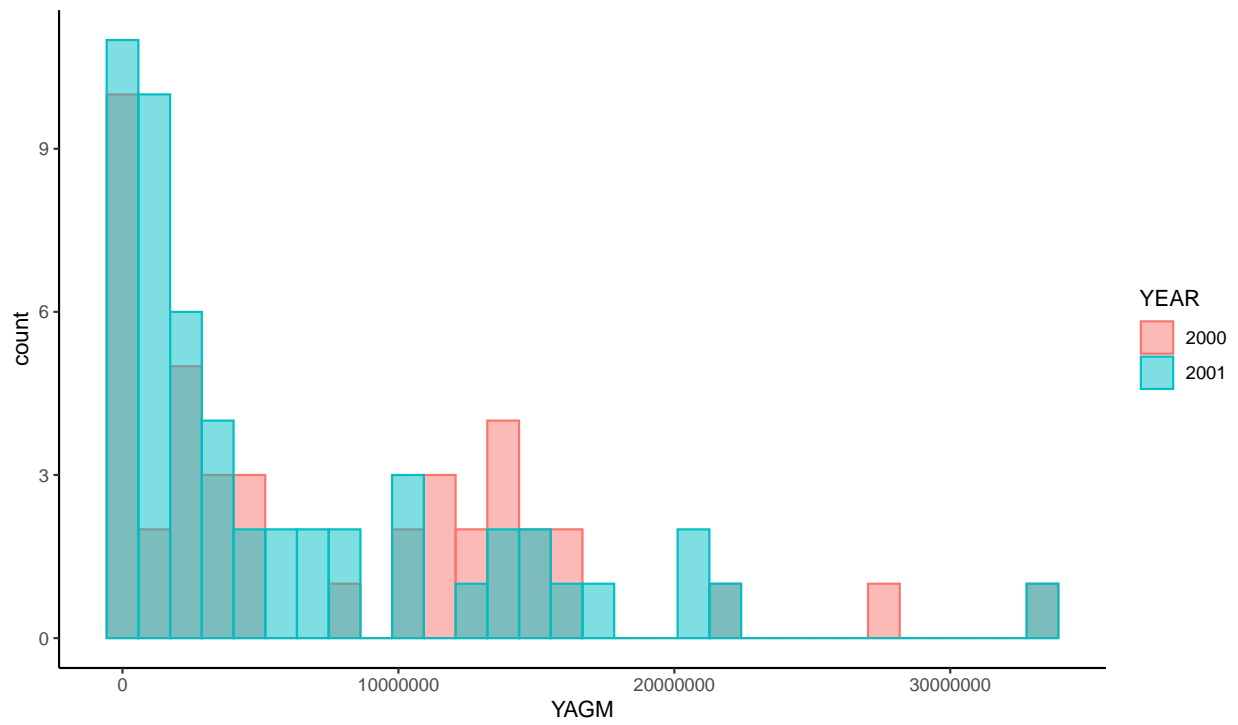

sub range 1

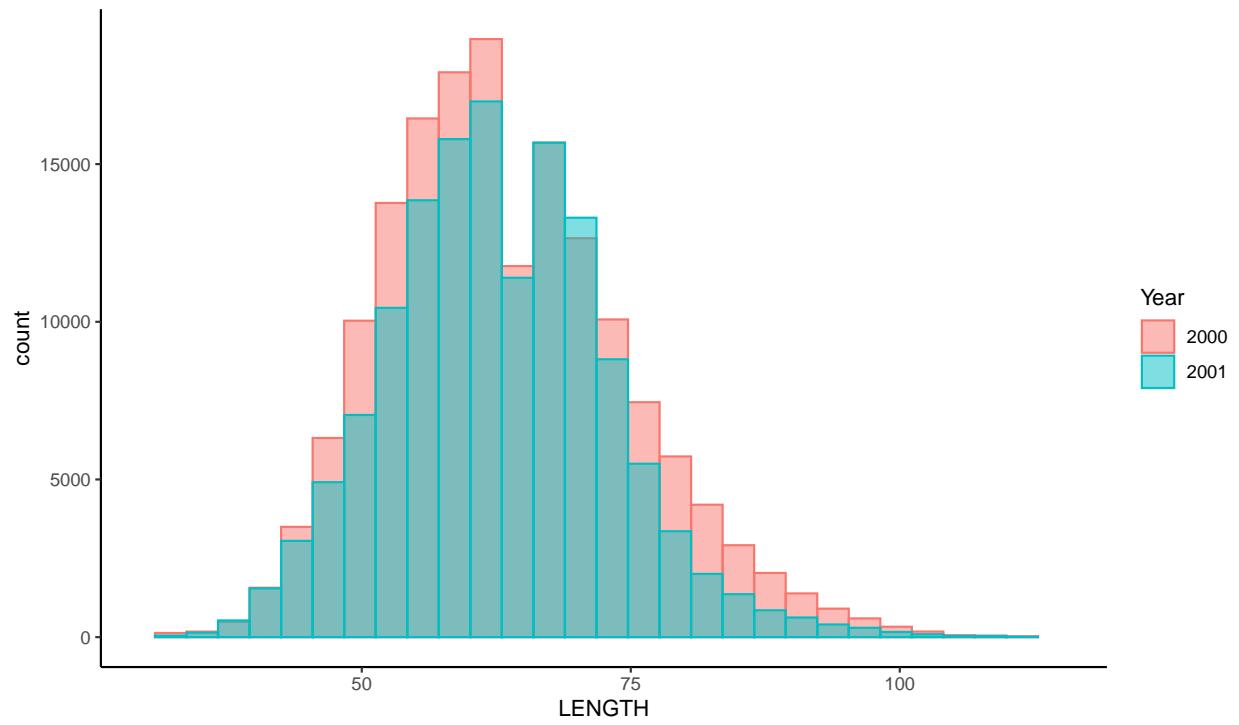

* reorder long

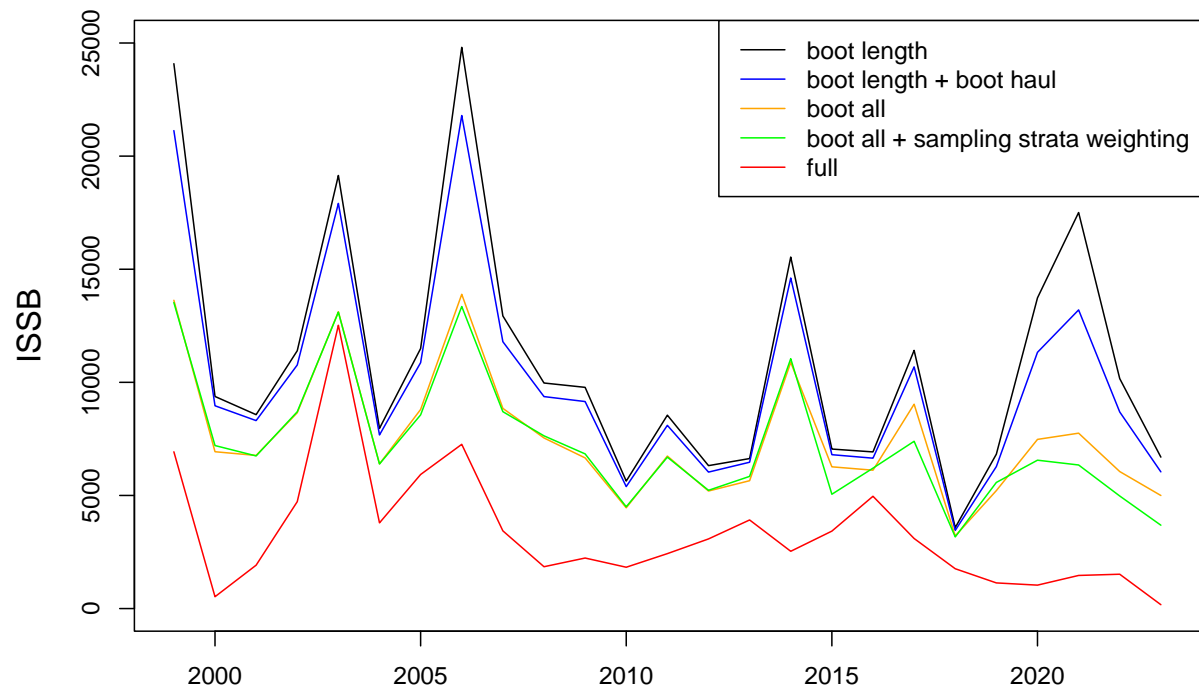

* Inspect 2000, 2001 for expansion drop

reorder short

reorder short with half trips and half hauls

reorder short 2

Full, half trip, half haul

Full, 1.5 trip, 1.5 haul

Plot 7x2 Grid Haul and Trip numbers

Trip Change

Boxplots

REMEMBER! these are the full year range, may want to narrow it to recent range.

Haul Change

Boxplots Haul and Trip

* Boxplots Together 1977-2023

Boxplots Together 1999-2023

Boxplots Together 1999-2023 TAKE TWO. fix mistake? NO ITS THE SAME AS ABOVE

Boxplots samples

Validate N=20 assumption

is assuming n=20 when the median is 20 for 1999-2023 valid to make a valid control? How well do they match?

Boxplots Together 1977-2023

* Samples VS Expantion. Boxplots Together 1999-2023

Samples VS Expantion TAKE 2: relative to unbiased control. Boxplots Together 1999-2023

Samples VS Haul. Boxplots Together 1999-2023

Samples VS Haul. Boxplots Together 1999-2023. sub-sample range

Samples VS Haul TAKE 2: relative to unbiased control. Boxplots Together 1999-2023. sub-sample range

Samples VS Trip. Boxplots Together 1999-2023

Samples VS Trip TAKE 2: relative to unbiased control. Boxplots Together 1999-2023

Samples VS Trip/Haul. Boxplots Together 1999-2023

Samples VS Trip/Haul TAKE 2: relative to unbiased control. Boxplots Together 1999-2023

Figure 7 Boxplots

Trip and Haul over sample size. Trip first Haul second. 1999-2023. Plot A includes scenarios relative to themselves at different sample sizes Plot B includes scenarios relative to the standard scenario at different sample sizes.

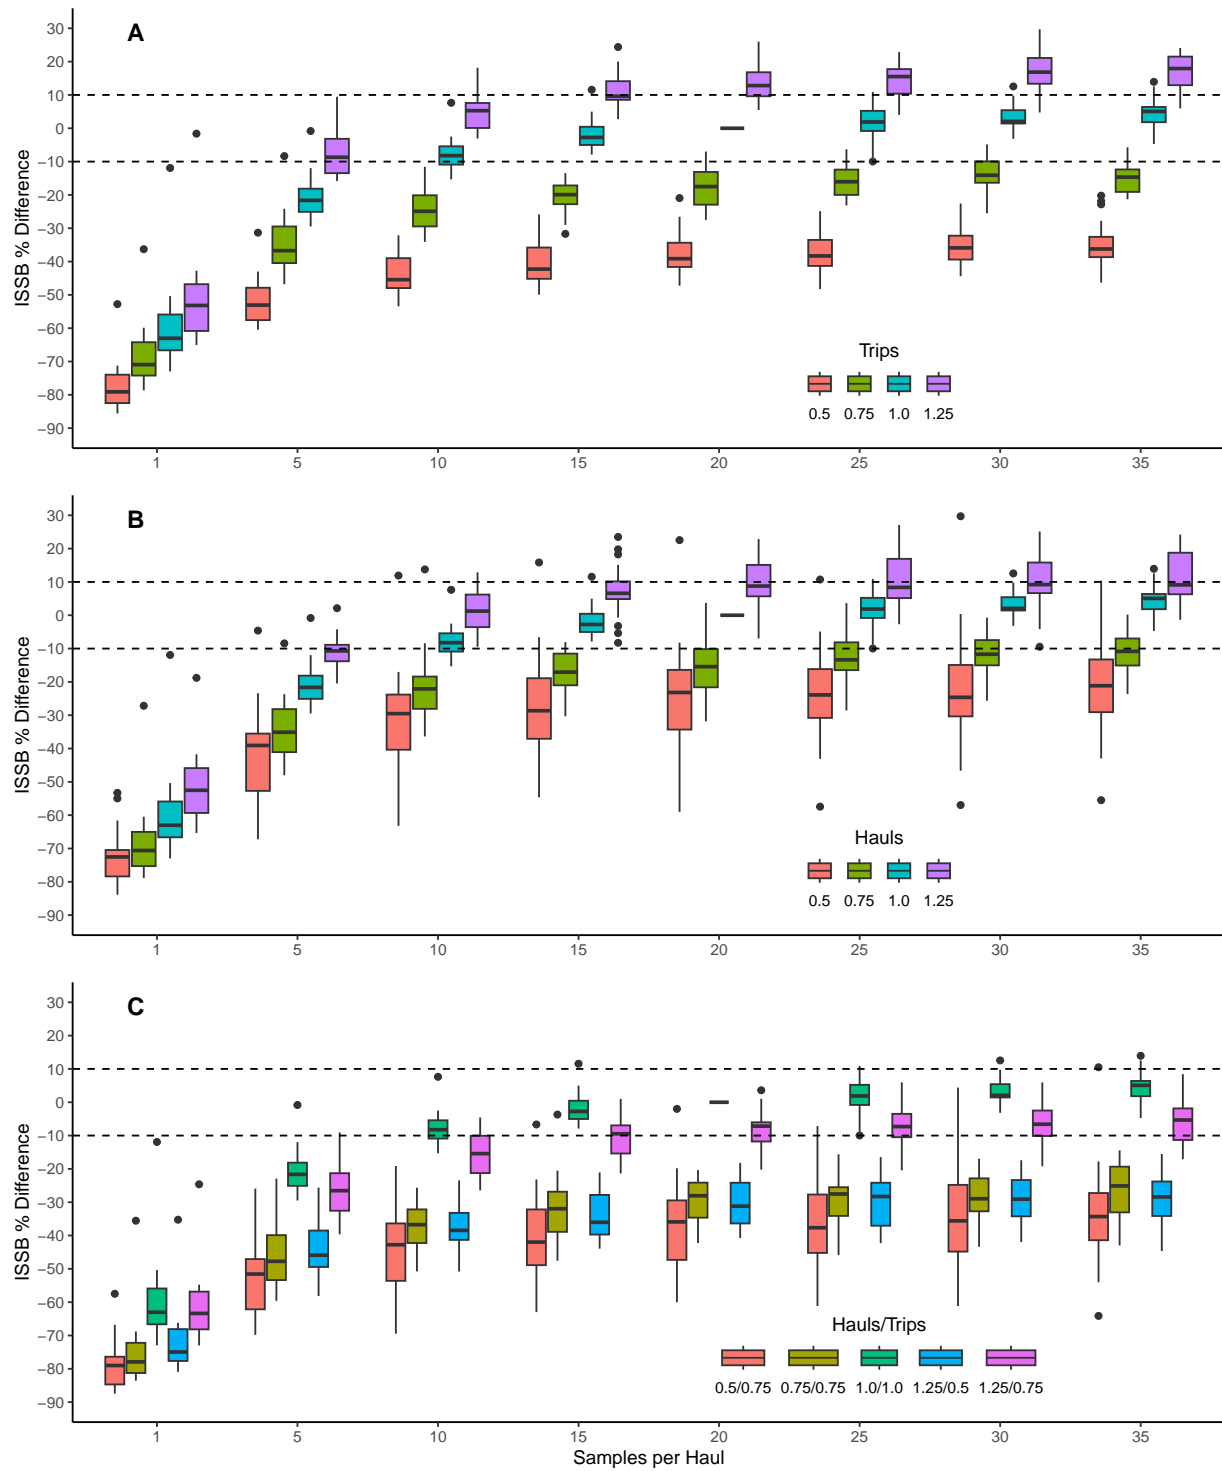

Take Two

* 3 Panel

Plot 3.1

3x3 grid.

Data

* With sampling strata

Without sampling strata

Plot 4.1 Trip and Haul x .5, 1.5

2x3 grid.

Data

Trip

Haul

Correlation Plots

Can I calculate the intra-haul correlation between samples and plot that against sample size for average over the sampling years?

I would have to sample with replacement lengths at every sample size and save them then `corr()` them, or save the `corr()` for every iteration, or save the average `corr()` over all iterations - then I could average over years to come up with either a boxplot or line plot.
